{e}Q: In order for the first derivative to be continuous, does that mean the second derivative has to be discontinuous? If I'm looking at a function $f(x) = 1/x$, is it true that at $x = 0$, the first derivative of $f(x) = 1/x$ does not exist (since it is undefined)? This means the second derivative does not exist (since the second derivative is the first derivative divided by itself).

A: Your function is twice differentiable, it has a continuous first derivative everywhere. The second derivative exists everywhere, but it is discontinuous at $x=0$.

Indore: An order was issued on Monday by the Central Reserve Police Force (CRPF), which resulted in over 1,200 police personnel to be deployed in the fifth phase of the Chhota Udepur division in Gujarat's Raghog State. A large number of policemen from the CRPF will be deployed for maintaining law and order in the fifth phase of the UP Assembly elections. It has been revealed that a team of the CRPF was deployed for the first time in the Chhota Udepur Parliamentary constituency as policemen were concerned about the possibility of violence after the announcement of the counting of votes, which was held on Monday. Around 9,000 policemen from the local government, district police and the central forces are expected to be stationed in the state from 11 to 15 April to maintain law and order. The counting of votes will be held on 16 April. The counting process will take place in the observance of political parties, the general elections commission and the election commission of India. The best policy: create more opportunity, so people can actually get better jobs and make a living. This is

the right way to conduct government policy. It's also the most productive, but it's becoming increasingly difficult to craft a successful policy on this basis. For businesses, the issue is not so much access to labour or markets but the ability to fill vacancies. If employers have to engage in overcapacity to meet demand, then the availability of labour inevitably suffers. Some of this is structural: economists estimate that it takes two years for a new graduate to find a job that matches the qualifications they have. This means that employers have to spend more time and resources filling vacancies, rather than employing their workers – the flip side of what most people want when
